

Gray-level Binary Fonts Exercise [Help]

Help: The following tips will help you complete this exercise:

- In order to count the number of halftones of each pixel, you must first divide 256 by the number of halftones that was given by the user.
- To display two images as one, you can use the NumPy.hstack() or NumPy.vstack() functions.
- When displaying the image, if it is entirely white or black, try specifying its data type using the .astype() function.
